In Mexico, mosquito-borne diseases are a growing threat to local communities. We are using our self-sustaining solution to introduce naturally occurring Wolbachia bacteria to mosquito populations in Mexico.

Following the signing of the project agreement in June 2017 between Monash University and Baja California Sur Health Secretariat, the project engaged with the community to explain how the Wolbachia method works to prevent mosquito-borne diseases.

In March 2018, the World Mosquito Program established a partnership with the government health authorities in Baja California Sur to establish Mexico’s first project in La Paz. Local and national government officials are supporting the project, hoping it can offer a long-term, sustainable alternative to current disease-control approaches.

Beginning in January 2019, Wolbachia-carrying mosquitoes were released in two pilot areas in La Paz. Mexico is the first country in North America to collaborate with the World Mosquito Program. City-wide releases began in February 2020.
There have been many cases of diseases transmitted by mosquitoes and I don’t want this to happen anymore. My children mentioned the success of this program in other places and we decided to support it.

- Francisca Osuna Mayoral
  Community container host

Communities in Mexico embrace the Wolbachia method

Mosquito-borne diseases cause significant financial pressure on families as people who fall ill are unable to work or attend school, and relatives often need to take time off to care for them. On a global scale, research has identified that families cope with 45 per cent of the total cost of dengue – caring for an affected member can triple monthly household expenses.

In the past, communities have suffered from dengue outbreaks in La Paz and other parts of Mexico. This is what drives the World Mosquito Program to work there. With the first phase of releases in La Paz, more than 1800 community members showed their support by volunteering to host ‘Zancu KITs’.

- Mario Espinoza,
  Zancu KIT host

Citizens of Baja California Sur have joined us in one of our many events, listened or read about the Wolbachia method, shown an interest with their questions and comments and hosted Zancu KITs in their patios, gardens or trees.

About us

The World Mosquito Program (WMP) is a not-for-profit group of companies owned by Monash University that works to protect the global community from mosquito-borne diseases. The World Mosquito Program uses naturally occurring bacteria called Wolbachia to reduce the ability of mosquitoes to transmit viruses to humans.

Following decades of research and successful field trial results, the World Mosquito Program is currently partnering with communities in 14 countries around the world to implement our ground-breaking solution. We have staff working in countries across Oceania, Asia, Europe, and the Americas, and offices established in Australia, Vietnam, France and Panama.

Our approach has widespread support from communities, governments, research institutes and philanthropic partners around the world. Through collaboration and innovation, we are making a difference to millions of lives.
